

AI Usage DISCLOSURE FORM

1. Team Details

Team Name: Nexora

Project / Product Name: AEGIS

Organization / Institution (if any): M S Ramaiah Institute Of Technology

Submission Date:08-05-2025

2. AI Usage Declaration

Did your team use any Artificial Intelligence (AI) in developing this project? Yes / No

Yes

3. Purpose of AI Usage

Idea generation / brainstorming: Self-Generated. The core concept of "Aegis" and the specific "State-Based Zen Mode" architecture were entirely our original ideas. We used AI only to validate the feasibility of the real-time interception logic.

Code generation or assistance: Assisted by AI. We leveraged AI as a high-speed pair programmer to handle the heavy lifting of the React frontend refactoring and to help structure the more complex TypeScript types in the backend.

UI / UX design: Self-Designed with AI assistance. We defined the "Glass Morphism" aesthetic and the specific user flows. We used AI to quickly implement the Framer Motion animations and CSS variables we had envisioned.

Content creation: Assisted by AI. We used AI to help us summarize the intercepted messages for the final digest and to assist in drafting professional documentation for the project.

Data analysis: AI-Powered. We integrated Llama 3.1 to handle the real-time semantic analysis of incoming messages, which allows the system to distinguish between casual chatter and high-priority emergencies.

Testing / debugging: Assisted by AI. We used AI to help us quickly track down socket.io connection issues and to debug the headless browser authentication flow for WhatsApp.

4. Feature Origin Classification

1. Feature Name: State-Based Zen Mode

Self-Generated/AI-Generated/Both: Both

Description: We designed a state machine that transitions the UI from an Idle setup mode to a distraction-free Zen state. We provided the architectural logic, and we used AI tools to help us implement the fluid transitions and the ripple background effects we wanted.

2. Feature Name: Hybrid Layered Classifier

Self-Generated/AI-Generated/Both: Both

Description: This was our solution to the latency problem. We built a three-layered filter (Regex -> Context -> LLM). We manually defined the Regex and identity-matching logic, and we used a combination of OpenClaw and Llama 3.1 to handle the final semantic reasoning for complex Hinglish phrases like "prod gaya."

3. Feature Name: Human-in-the-Loop Feedback Loop

Self-Generated/AI-Generated/Both: Both

Description: We wanted a way for the user to "teach" the AI. We designed the logic where clicking a 'dislike' button on a misclassified message updates the backend's `memory.json`. We used AI to help us wire up the `/api/webhook/learn` endpoint to the frontend modal we had designed.

5. Ethical & Compliance Confirmation

AI usage complies with guidelines and policies. **Yes**

No proprietary or copyrighted data misused. **I Agree**

6. Declaration & Sign-Off

Name of Team Representative: Akuthota Sai Deepak

Role: Team Lead and Backend Developer

Signature: A.Sai Deepak

Date: 08-05-2026
